

ABSTRACT

A 3D surround system (100) including a plurality of speakers is provided, a guidance-information acquiring unit (101) acquires information on route guidance, and a control unit (102) controls output of a guide sound so that a direction from which the guide sound is heard moves based on the information acquired by the guidance-information acquiring unit (101) by using at least two speakers included in a speaker group (103) at the same time. In addition, the output of the guide sound is controlled by using a speaker only for low-pitched sound reproduction (104) included in the speaker group (103) and the speaker group (103) at the same time.
